common ground

cg360° Team Room

People and agents working together.

Your AI starts over every single time.

You tried AI as a subscription and found it does not know anything about your business. Every task restarts from zero, so the work never compounds. Team Room hands you an appliance instead: your people and your agents working together, on your own machine, with memory that belongs to you and goes with you.

YOUR AGENTS

Named and persistent, asked to prove the work, not just report it.

YOUR MACHINE

A dedicated appliance on your own private network, provisioned as one repeatable operation.

YOUR DATA

Nothing is shared between tenants, memory included. It belongs to you and goes with you.

A subscription gives you a seat on someone else's system. This gives you the system.

WHAT YOU ACTUALLY GET	ChatGPT Enterprise	M365 Copilot	Team Room
Answers general questions well	●	●	●
Knows how your business actually runs	◐	◐	●
Remembers the work across sessions	●	●	●
Runs on hardware you own	○	○	●
Not tied to one model provider	○	◐	●
The memory is yours and leaves with you	○	○	●

We name every outage, what caught it and how long it took, before you ask. An appliance nobody operates is just hardware; the operating is the product.

NOTHING SHARED

Not the box.
Not the memory.

See it running

DEMO

The pod we run our own company on, failures included.

Stand up your box

PROVISIONING

A dedicated appliance, your agents, your network. One repeatable operation.

Keep it running

OPERATED

We operate it, and tell you what broke before you ask.

Ask it something only your business would know.
